

Tensa4 assembly instructions update

We have changed how Tensa4 poles join. The ball loop connectors are now longer to make carabiners unnecessary. This note amends the complete instructions while we redraw them.

1. Thread ball loop through one pole

2....then through the other

3. Pass loop through webbing or Amsteel loop

4. Pull loop over ball to secure

If you prefer to connect the lines after the poles, skip step 3 until you are ready.
